

TaleDates Deployment Plan

1. Deployment Overview

This document describes the deployment approach for the TaleDates Support Workspace Salesforce solution. The goal is to move the completed configuration from the development environment into a production-ready environment safely and efficiently.

2. Current Development Environment

The solution was developed using Salesforce Developer Edition and includes Custom Objects, Custom Fields, Relationships, Lightning Record Pages, Salesforce Flows, Agentforce Configuration, Reports, Dashboards, Permission Sets, and Security Settings.

3. Deployment Strategy

The recommended process follows Development Environment -> Testing and Validation -> Production Environment. Steps include reviewing configuration, testing automation and Agentforce, deploying metadata, validating components, and enabling production features.

4. Components to Deploy

Salesforce Configuration: Custom Objects, Fields, Relationships, Page Layouts, and Lightning Pages.

Automation: Record-Triggered Flows and Screen Flows.

Agentforce: Agent Definition, Agent Router, Subagents, Actions, and Flow integrations.

Analytics: Reports and Dashboards.

Security: Permission Sets and Sharing Settings.

5. Testing Plan

Tests include creating and updating Cases, verifying Related Order linking, testing Agentforce order information retrieval, validating escalation automation, checking permissions, and confirming dashboard accuracy.

6. Go-Live Plan

Before launch: backup data, deploy metadata, validate functionality, activate Agentforce, and monitor errors and user feedback.

7. Maintenance Plan

After deployment: monitor Flow failures, update Agentforce instructions, review dashboards, improve automation, and add future enhancements.

Conclusion

The TaleDates Deployment Plan provides a structured approach for safely releasing the Salesforce support solution while maintaining reliability, security, and scalability.
