

TaleDates Customer Support Solution

Project Proposal Document

Salesforce & Agentforce Capstone Project

Prepared by	Naif Almalki
Program	SmartBridge Salesforce Program
Project Organization	TaleDates
Platform	Salesforce Developer Edition
Proposal Date	August 2026

Proposal for a secure, automated, and AI-assisted customer support workspace on Salesforce.

1. Executive Summary

TaleDates is an e-commerce business that requires a centralized and scalable way to manage customer support requests related to orders, shipping, product information, damaged items, and replacements. The proposed project will use Salesforce to organize support operations, improve data quality, automate repetitive activities, provide management visibility, and introduce an AI-assisted support experience through Agentforce.

The proposed solution will extend Salesforce Case Management with a custom TaleDates Order object, custom Case fields, validation rules, Salesforce Flow automation, Dynamic Forms, a Lightning Web Component, reports and dashboards, role-based security, and an Agentforce assistant grounded in Salesforce order records.

The project will be implemented in a Salesforce Developer Edition environment using test data. Live integration with the production TaleDates store, shipping providers, payments, and customer messaging channels will remain outside the initial capstone scope.

2. Business Background and Problem Statement

Customer-support teams need fast access to accurate order information while maintaining consistent case records and protecting customer data. Without a centralized support process, agents may spend unnecessary time locating order details, cases may be created without required information, and high-priority issues may not be escalated consistently.

The proposal addresses the following business problems:

- Order status, tracking, product, shipping, and payment-value information may require manual lookup.
- Order-related support cases may be incomplete if no related order is captured.
- Damaged-product cases require additional fields that should not clutter unrelated cases.
- High-priority cases require consistent escalation handling and auditability.
- Managers need clear reporting on support categories, case priorities, and order statuses.
- Support users should have only the minimum permissions needed to perform their role.
- AI responses must be grounded in verified Salesforce data and must not fabricate order or delivery information.

3. Project Objectives

The project aims to deliver the following outcomes:

1. Centralize customer-support cases in Salesforce.
2. Connect support cases to TaleDates order records.
3. Display important order information directly on the Case record.
4. Improve data quality through validation rules and controlled input.
5. Automate case creation, order lookup, and high-priority escalation using Salesforce Flow.
6. Provide a clean support-agent experience using Lightning pages and Dynamic Forms.

7. Provide operational visibility through reports and a support dashboard.
8. Apply least-privilege access using profiles, permission sets, private sharing, and role hierarchy.
9. Introduce an Agentforce assistant that routes support requests and retrieves trusted order information.
10. Maintain auditability through Case History Tracking and repeatable testing.

4. Proposed Project Scope

4.1 In Scope

Area	Proposed Scope
Customer Support	Salesforce Cases, support categories, priority, related order, escalation reason, damage and replacement fields.
Order Data	Custom TaleDates Order object with order number, customer, contact, status, product summary, tracking number, shipping city, and total amount.
Automation	Validation rule, support-case Screen Flow, order-lookup Autolaunched Flow, and high-priority Record-Triggered Flow.
User Experience	TaleDates Support Workspace, Lightning Home Page, customized Case page, Dynamic Forms, and TaleDates Order Snapshot LWC.
Agentforce	TaleDates Support Assistant, Agent Router, specialized subagents, and a Salesforce Flow action for order lookup.
Analytics	Reports for support categories, priorities, and order status; TaleDates Support Dashboard.
Security & Audit	Profile, Permission Set, Organization-Wide Defaults, Role Hierarchy, field/object permissions, and Case History Tracking.

4.2 Out of Scope

- Live integration with the production TaleDates e-commerce store.
- Real-time order synchronization from external commerce systems.
- Direct integration with shipping carriers.
- Payment or refund processing.

- WhatsApp, email, or social-media channel integration.
- Migration of real production customer data.
- Full customer-facing public chatbot deployment.
- Production deployment to a live Salesforce production organization.

5. Proposed Solution

The proposed solution uses Salesforce as the central customer-support platform. Cases will represent support requests, while the custom TaleDates Order object will provide the order information needed by support agents. The Case and order records will be connected using a Related Order lookup.

Automation will be implemented with Salesforce Flow. A Screen Flow will guide support-case creation, an Autolaunched Flow will retrieve TaleDates Order information, and a Record-Triggered Flow will populate an escalation reason for high-priority cases. A validation rule will prevent relevant order-related cases from being saved without a Related Order.

The Lightning user experience will present order information directly on the Case page through a custom TaleDates Order Snapshot Lightning Web Component. Dynamic Forms will show damage and replacement fields only when the selected support category requires them.

Agentforce will provide AI-assisted support. The TaleDates Support Assistant will route user intent to specialized subagents. Order-related questions will invoke a Salesforce Flow action so responses are based on actual Salesforce order records rather than generated estimates.

6. High-Level Requirements

ID	Requirement
PR-01	Create and manage customer-support Cases in Salesforce.
PR-02	Classify Cases using Support Category and Priority.
PR-03	Relate applicable Cases to TaleDates Order records.
PR-04	Require a Related Order for applicable order-related support categories.
PR-05	Display linked order information on the Case record.
PR-06	Show damage and replacement fields only for relevant cases.

PR-07	Automatically populate an escalation reason for High priority cases.
PR-08	Provide a guided Flow for creating support cases.
PR-09	Retrieve order details through an Autolaunched Flow.
PR-10	Handle invalid order numbers through a controlled Order Not Found path.
PR-11	Route support requests through Agentforce subagents.
PR-12	Ground Agentforce order responses in Salesforce records.
PR-13	Provide reports and a dashboard for support operations.
PR-14	Track selected Case field changes for audit purposes.

7. Security and Responsible AI Approach

The proposal follows least-privilege and responsible-AI principles. Support users will receive only the permissions required to work with support cases and view order information. Cases and TaleDates Orders are proposed to use Private organization-wide defaults, with access supplemented by role hierarchy and permission assignments.

Responsible-AI controls will include:

- Use Salesforce TaleDates Order records as the source of truth for order-specific responses.
- Instruct the Order Status & Shipping subagent not to invent tracking numbers, order statuses, customer information, or delivery information.
- Use a controlled Order Not Found path when no matching order exists.
- Limit the order-lookup action to the data needed for the support scenario.
- Test and version Agentforce changes before activation.

8. Implementation Plan and Milestones

Phase	Focus	Key Activities
Phase 1	Requirements & Data Model	Confirm support scenarios,

		create TaleDates Order object, fields, relationships, and Case customizations.
Phase 2	Security & Core Configuration	Configure profile, permission set, sharing model, role hierarchy, validation, and history tracking.
Phase 3	Automation & UI	Build Salesforce Flows, Lightning pages, Dynamic Forms, and the TaleDates Order Snapshot LWC.
Phase 4	Agentforce & Analytics	Configure the TaleDates Support Assistant, subagents, order lookup action, reports, and dashboard.
Phase 5	Testing & UAT	Test valid and invalid paths, security, UI behavior, automation, analytics, and Agentforce responses.
Phase 6	Documentation & Demo	Prepare configuration documents, deployment plan, Flow demo, final presentation, and submission package.

9. Risks, Constraints, and Mitigation

Risk / Constraint	Potential Impact	Mitigation
Data mismatch or missing test records	Flows or Agentforce may return no data.	Use controlled test records and validate order numbers before UAT.
Permission misconfiguration	Users may see too much or too little data.	Apply least privilege and verify object/field access during testing.
Flow errors	Automation may fail after configuration changes.	Use Flow Debug, active version control, and regression testing.
AI hallucination	Agent may generate unsupported order information.	Ground responses in Salesforce data and define explicit no-

		invention instructions.
Scope expansion	External integrations may exceed capstone time and platform limits.	Keep live commerce, carrier, payment, and messaging integrations out of the initial scope.
Developer Edition limits	Some production features or capacities may be unavailable.	Design and demonstrate the solution within Developer Edition capabilities.

10. Success Criteria

The proposal will be considered successful when the following criteria are demonstrated:

- A support Case can be created and categorized successfully.
- Applicable order-related Cases cannot be saved without a Related Order.
- Linked order information is visible from the Case page.
- Damage and replacement fields appear only for the relevant support category.
- High-priority Cases receive the expected escalation reason automatically.
- Valid order lookup returns the correct Salesforce record information.
- Invalid order lookup follows the Order Not Found path.
- Agentforce routes order inquiries correctly and returns grounded order information.
- Reports and dashboard components display the expected support data.
- Support-user security reflects the intended least-privilege model.

11. Expected Deliverables

- Project Proposal Document.
- Salesforce Org Configuration Document.
- Agentforce Configuration Document.
- Flow Automation Demo.
- Final Project Demo & Presentation.
- Deployment Plan.

12. Expected Business Benefits

Benefit	Expected Value
Faster support handling	Agents can access order information from the Case instead of searching across disconnected processes.

Higher data quality	Validation and guided input reduce incomplete support records.
Consistent escalation	High-priority cases receive standardized escalation information.
Cleaner user experience	Dynamic Forms and the custom LWC surface only relevant information.
Better visibility	Reports and dashboards provide a consolidated operational view.
Safer AI assistance	Agentforce uses trusted Salesforce records and controlled fallback behavior.
Improved governance	Private sharing, least privilege, role hierarchy, and history tracking support secure operations.

13. Proposal Conclusion

The TaleDates Customer Support Solution proposes a practical Salesforce implementation that combines case management, order visibility, workflow automation, analytics, security, custom Lightning development, and Agentforce. The scope is intentionally focused on a demonstrable capstone solution that can be tested in Salesforce Developer Edition while leaving live external integrations for a future phase.

If approved, the project will proceed through configuration, automation, Agentforce implementation, testing, documentation, and demonstration using the phased plan described in this proposal.
